Tech Stack

1. Java
2. External tools/libraries:
    a. Scanner for reading input, but I am interested in exploring other parsing libraries
    b. File I/O for saving and loading existing entries from a file
    c. Git/GitHub for tracking changes
    d. GSON for when I use a JSON file
3. Data storage
    a. I'll potentially implement a .txt file to read and update to create parsing functionality
    b. I'll then explore using a JSON file for local storage
4. External data
    a. No external APIs or data required
    b. To build V2.0+ recommendations feature, only subject research will be required but no pulling data from external sources for any pipelines within the program
